

Your central key for data encryption and protection

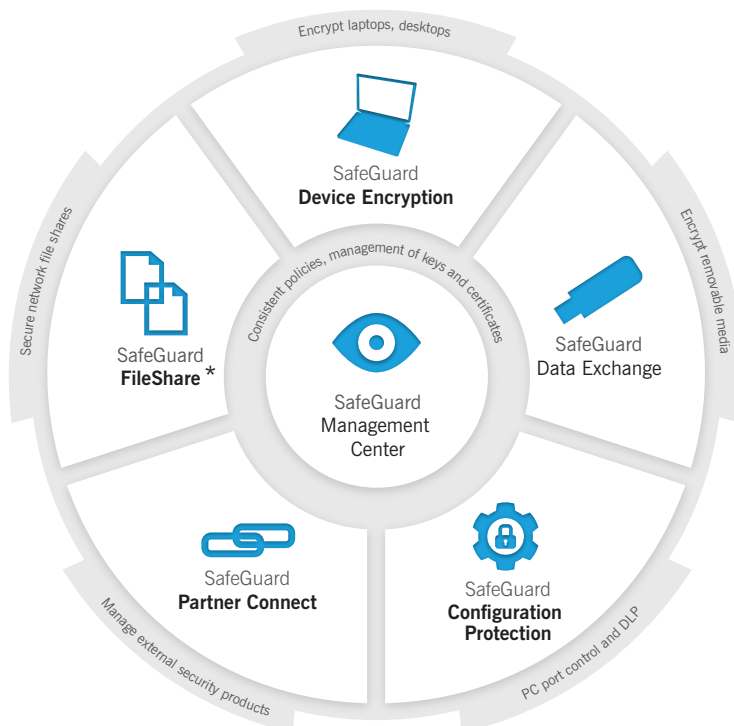

SafeGuard Enterprise provides multi-layered endpoint data security combining encryption and data loss prevention (DLP). The centrally managed solution secures data on desktops, laptops, PDAs, smartphones and removable media. Its transparent data encryption enhances user productivity while preventing malicious users from reading lost or stolen media. SafeGuard Enterprise prevents endpoint data leakage by controlling access to both physical and wireless interfaces (e.g., USB, FireWire, Wi-Fi) and storage devices (e.g., MP3 players, removable media).

Protect your confidential information and comply with regulatory mandates—safely and securely—with Sophos’s comprehensive SafeGuard Enterprise solution. SafeGuard Enterprise is a modular information protection control platform that enforces policy-based security for PCs and mobile devices across mixed environments. It is fully transparent to end users and is easy to administer from a single central console. SafeGuard Enterprise provides multi-layered endpoint data security by combining encryption and data leakage prevention. Its modular architecture provides comprehensive data security tailored to your organization’s needs and growth requirements.

Manage policy and regulatory compliance risks easily and effectively

Protecting confidential personal data from disclosure is a fundamental legal requirement for many companies worldwide. SafeGuard Enterprise bolsters compliance measures by enforcing centralized policies for encryption and data leakage prevention, with verifiable audit logs and reports.

SafeGuard Enterprise: A modular data security solution

SafeGuard Enterprise modules:

SafeGuard Management Center

- » Implements and enforces a common, organization-wide security policy framework, providing a central point of management control in mixed IT environments

SafeGuard Device Encryption

- » Transparently encrypts data on laptops, desktops and external media, protecting users against unauthorized access, loss or theft of data

SafeGuard Data Exchange

- » Ensures the secure exchange of data via removable media with business partners and customers, even if they do not have a SafeGuard application installed

SafeGuard Configuration Protection

- » Offers central control over fixed and mobile devices, protecting against malware, inappropriate software use and unauthorized configuration changes

SafeGuard Partner Connect

- » Manages external data security applications (e.g., Windows BitLocker Drive Encryption)

SafeGuard FileShare*

- » Encrypts user data across working groups; protects data on local drives and network servers, at both the file and the directory level

Secure productivity and collaboration with state-of-the-art key management

Behind-the-scenes key management enables legitimate users to easily and securely share data across PCs, removable media and even email attachments. SafeGuard Enterprise provides centralized, state-of-the-art key management from a single console. It is simple and easy to securely store, exchange and recover keys in mixed environments.

Improve business processes with centralized security control

Managing data security in heterogeneous enterprise environments with various devices and platforms can be challenging. When employees, business partners and customers have access to data from many locations, protecting this information requires strong, centralized management. SafeGuard Enterprise delivers centralized security control across mixed IT environments, using role-based management to enable granular policy enforcement—far superior to pure point products. Automated tools streamline deployment, and data can be quickly recovered if employees forget passwords, resign or lose authorization.

Business confidence with transparent security and data recovery

Encryption processes are automated and transparent to users, even during initial installation, allowing users to work without interruption. Fast and secure authentication is enabled by biometric fingerprint and cryptographic token support. Recovering forgotten passwords is easy with secure challenge response over the phone or via local self help. It also supports standard system and data recovery and forensics tools after proper authentication.

Investment protection with scalable architecture

SafeGuard Enterprise offers superior scalability and broader compatibility compared to point security solutions, and its modular architecture supports rapid business growth. SafeGuard Enterprise can administer external encryption technologies such as BitLocker Drive Encryption to secure data in Windows 7 and Vista operating systems. The SafeGuard Enterprise architecture can be further extended to support encryption platforms and products. Microsoft Active Directory directory services and Novell environments are also supported. Moreover, SafeGuard Enterprise supports multi-factor authentication with third-party tokens, smartcards and biometrics such as Lenovo fingerprint readers. End users benefit from seamless security across devices and platforms with the added convenience of single sign-on for greater productivity.

**Future release. This functionality is currently provided by SafeGuard LAN Crypt.*

Gartner

- » Ranked leader in the Magic Quadrant for Mobile Data Protection
- » Highest marks for “Completeness of Vision”

- » Common Criteria EAL 3+

- » FIPS 140-2 validated cryptography

- » 5 on 5 Stars for 2008/09 AND 2009/10

“A great enterprise product with tons of useful features”

“Installation...easy”

“Performed very well”
